

Webster Township Surface and Groundwater Contamination Risk Map

Risk Level

- Low (0-50%)
- Moderate (50-70%)
- High (70-100%)

Contamination Risk Calculation

The risk level is calculated based on three key factors: soil structure (40%), distance to water bodies (40%), and area slope (20%).

Soil structure is assessed by its sand content, areas with higher percentages of sand are considered more at risk. The percentage of sand is converted to an index ranging from 1 to 100.

Distance to water considers proximity to streams, wetlands, and lakes included in the analysis. This distance is also indexed from 1 to 100, with higher risk for areas closer to water bodies.

Slope of the area is estimated using elevation data as a proxy, also scaled from 1 to 100. Steeper slopes indicate higher contamination risk.
